Response to Amendment

1. Based on applicant's amendment, filed 4/16/2009, see page 1 of the remarks, with respect to amended claims 1, 4, 8, 9 and 11, have been fully considered and are persuasive, upon further consideration the 35 USC 101 rejection and rejection of 103(a) for claims 1-29, are hereby withdrawn.

The claims 1-29 are allowed.

REASONS FOR ALLOWANCE

2. The following is an examiner's statement of reasons for allowance.

This invention relates generally, to a method, an apparatus and a computer program for histological assessment of nuclear pleomorphism: it is particularly relevant to assessment of histological images to provide clinical information on cancers such as breast cancer.

Based on applicant's amendment, with respect to claim 1 representative of claims 9, 11, 12, 20 and 21 the closest prior art of record (Gabib and Lee), Gabib reference is directed to spectral methods in general and, more particularly, to spectral imaging methods for cell classification, biological research, and Lee reference is directed to an automated cytology system and more particularly to an automated cytology that identifies and classifies free-lying cells and cells having isolated nuclei on a biological specimen slide. But neither Gabib nor Lee teach or suggest, among other things, "groups of contiguous pixels and potentially corresponding to cell nuclei in histological image data, including steps of: thresholding the image data to render it binary with identified image regions and background distinguished from one another by association with different binary digits, determining perimeters and areas of identified image regions, calculating image region shape factors from the perimeters and areas and assessing nuclear pleomorphism from the shape factors' statistical parameters".

Additionally claim 4 representative of claims 15 and 24, the closest prior art of record (Gabib and Lee) do not teach or suggest, among other things, “nuclei in histological image data, the method including thresholding the image data to render it binary, determining perimeters and areas of identified image regions, calculating image region shape factors from the perimeters and areas, and assessing nuclear pleomorphism as being relatively low, moderate or high according to whether the mean or median of the shape factors is relatively low, moderate or high respectively”.

Further claim 8 representative of claims 19 and 28, the closest prior art of record (Gabib and Lee) do not teach or suggest, among other things, “decomposing colour image data into a set of sub-images each of which overlaps half of each of its neighbors, applying Principal Component Analysis (PCA) to each sub-image to obtain grayscale sub-images as first principal components, in order to provide improved image definition compared to an individual red green or blue plane in the color image data, removing from each sub-image regions at sub-image edges potentially corresponding to cell nuclei, thresholding the grayscale image data to render it binary, and determining perimeters and areas of identified image regions, calculating image region shape factors from the perimeters and areas and assessing nuclear pleomorphism from the shape factors' statistical parameters”.

These key features in combination with the other features of the claimed invention are neither taught nor suggested by (Gabib and Lee) prior art of record.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
